

Revising File Handling

01 March 2026 23:09

What is file handling?

File handling is the process of creating, reading, writing and modifying files stored on a storage device using a program.

Files allow data to be:

- Stored permanently.
- Retrieved later.
- Shared between programs.

Without file handling, data exist only temporarily in memory.

Types of Files in Python

1. Text files:

- Store data as characters.
- Human readable.
- Examples are .py, .txt, .csv, .html (any programming language code file is a text file.)

2. Binary files:

- Store data in binary form (0s or 1)
- Not human-readable
- Used for objects, images, audio, etc.

File operations in Python

Operation	Purpose
Open	Connect program to file
Read	Retrieve Data
Write	Store Data
Close	Release file resource

Opening a File

Syntax:

```
file_object = open("filename", "mode")
```

↑
should contain file path.

"r", "w", "a", "ab", "r+", "w+", "wb"

Creating a file and writing data into it.

```
fileName= input('Enter any file name: ')
fo = open("FileHandling/DataFiles/"+fileName, "w")
fo.write("Welcome again in the class of coding\n")
fo.close()
```

Reading from existing file:

```
fileName= input('Enter any file name: ')
fo = open("FileHandling/DataFiles/"+fileName, "r")
content = fo.read()
```

```
print(content)
fo.close()
```

Reading one line at a time:

```
fb = open("FileHandling/DataFiles/flowers.txt", "r")
print("Press enter key to continue and x or X to exit...")
while True:
    line = fb.readline()
    if not line:
        print('End of poetry')
        break
    print(line, end='')
    x = input()
    if x in ('x', 'X'):
        break
fb.close()
```

Append mode

```
fileName = input('Enter any file name: ')
fb = open("FileHandling/DataFiles/"+fileName, "a")
sent = input("Enter any sentence: ")
fb.write(sent+"\n")
fb.close()
```

WAP in Python to read any .py file and count number of lines present in the file, and print each line of the file.
